Do you want to be the best?

For many years the manufacturers, throwers and coaches have been talking about how far a javelin could be thrown, 60, 70, 80 or 90 meters. But what does that say to you? If you buy a 60 m javelin, will it fly only 60 meters or will it fly from 60 meters? Nobody ever knew, this is something that has always been labeled on the javelins and got stuck in our mind without any deep thought. Because the 60 meter javelin can do 80 meters without a problem, it actually depends on the athlete's technique and strength.

We put our minds together and started researching the subject about 2 years ago. After many interviews with throwers and coaches we realized that all of them are always speaking about the stiffness or softness of the javelin. Some athletes prefer the javelins very stiff, like Andreas Thorkildsen who uses Airglider Carbon, some prefer a softer javelin, like Marya Abakumova who uses Olympia Carbon.

Based on these facts we went back to the production and started measuring our javelins flex based on the scale from 0 to 20, with some very secret and advance technology. Zero being the stiffest and twenty the softest. We have also discovered that the closer to Zero javelin gets, the more the javelin requires from the thrower's technique.

So here you have a flex chart of our javelins, choose one that will meet your needs and requirements. You can now see what flex number our javelins have, new and old, you can also see what thrower the javelin will fit. For example if you throw over 75 meters, then the Eagle Carbon, Champion Carbon and Airglider Carbon will be suitable for you!

So, start talking Flex, stop talking meters!
